

### Description

#### HS Hydraulic Set Packer

The Model 'HS' is a compact, tough and reliable single string hydraulic set Retrievable Packer ideal for use in deviated wells, multiple packer completions and applications where the packer(s) is to be set after the well is flanged up.

Since no mandrel movement occurs during setting, the 'HS' may be used in either single packer installations, or as the lower packer in multiple zone dual completions. It is also ideal for multiple packer single string completion.

To set the packer pressure up against a plugging device such as a pump-out plug or wireline blanking plug sets the packer(s).

Setting pressure required depends on packer size and element system. To release the packer, a force in excess of the releasing shear value is pulled on the tubing.

This will open the equalizing system and release the packer.

### Features

Packer releases with a straight pick-up shear system, which is fully adjustable

Short compact design is ideal for highly deviated wells

All components locked to prevent present
